

Volumes in single hours 2006-2008 (MWh)

As the chart above shows, the number of hours with a volume of 100 MW or below could be practically eliminated. In 2006 the mean distribution was between 100 and 150 MW. With new market participants and the increase in the maximal size of blockbids from 200 to 500 MW, the volume distribution significantly got shifted upwards.
